

**Synergistic Reinforcement of Polyamide 6 Using Cellulose
Nanocrystals and Wood Fibers**

Adel Jalae, Johan Foster

Bioproduct Institute in Chemical and Biological Engineering at UBC

International Conference on Nanotechnology for Renewable Materials

Key Drivers for Polymer Composite Usage

- High specific strength and modulus (2-4GPa)
- Fuel-saving (30%)
- Recyclability
- Design flexibility
- Corrosion resistance

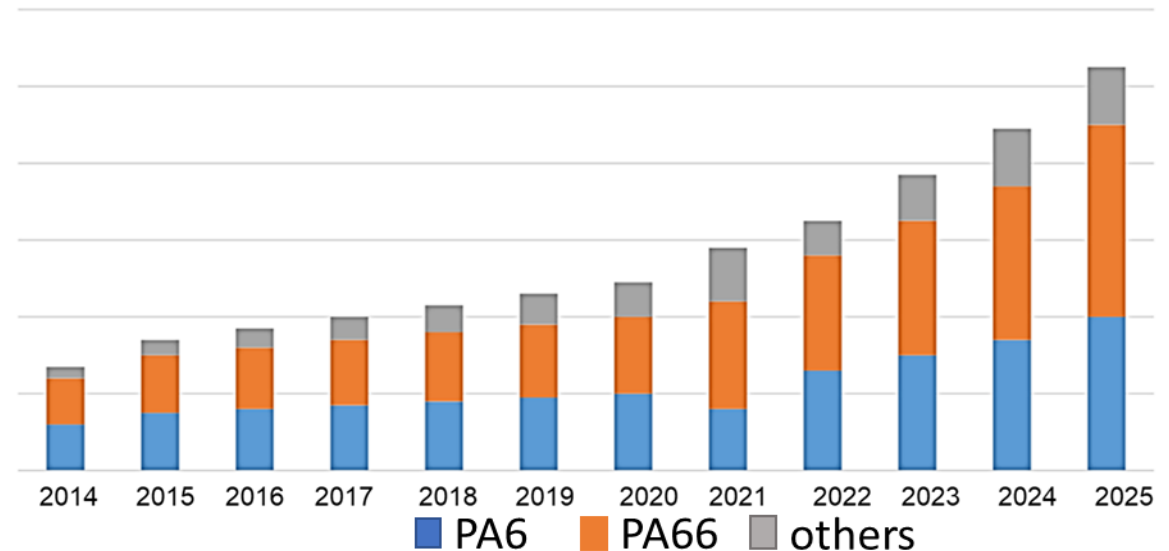

Matrix

Polyamide 6 (PA6)

$$T_m = 220^\circ\text{C}$$

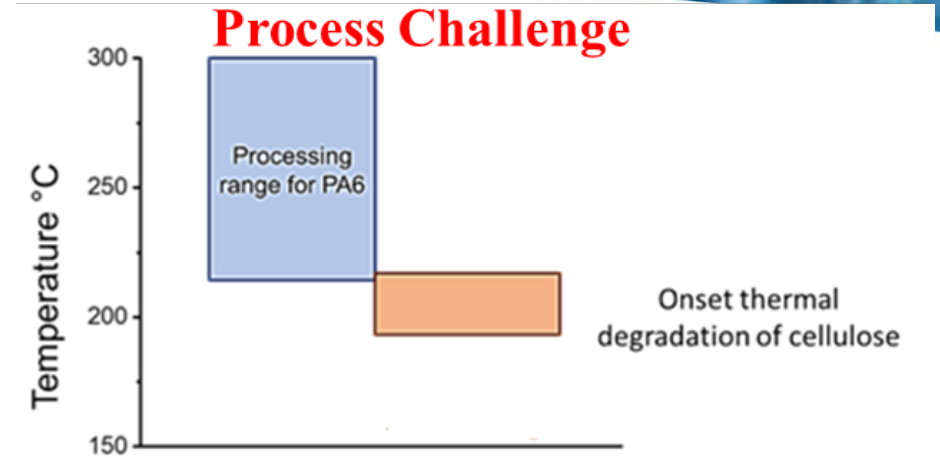

U.S Polyamide market revenue, by product, 2014-2025 (USD Million)

International Conference on Nanotechnology for Renewable Materials

Bio-based Fillers

- Biodegradable
- Lightweight
- Cost-effective and accessible
- Sustainable

Cellulose nanomaterials (CNMs)

nm

Saw dust

μm

Pulp fibers (PFs)

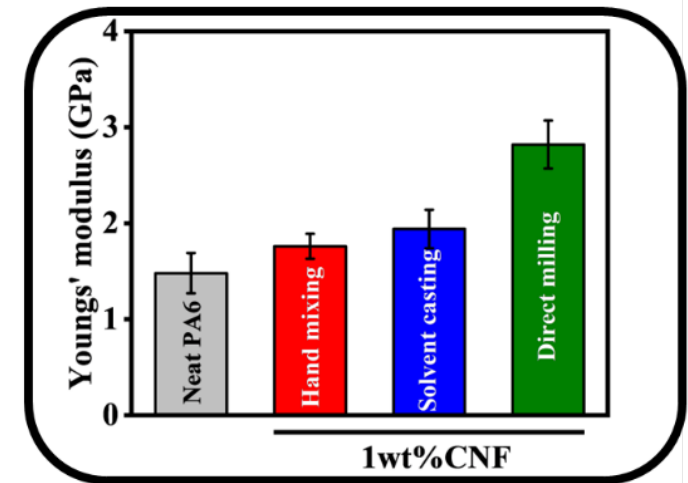

mm

International Conference on Nanotechnology for Renewable Materials

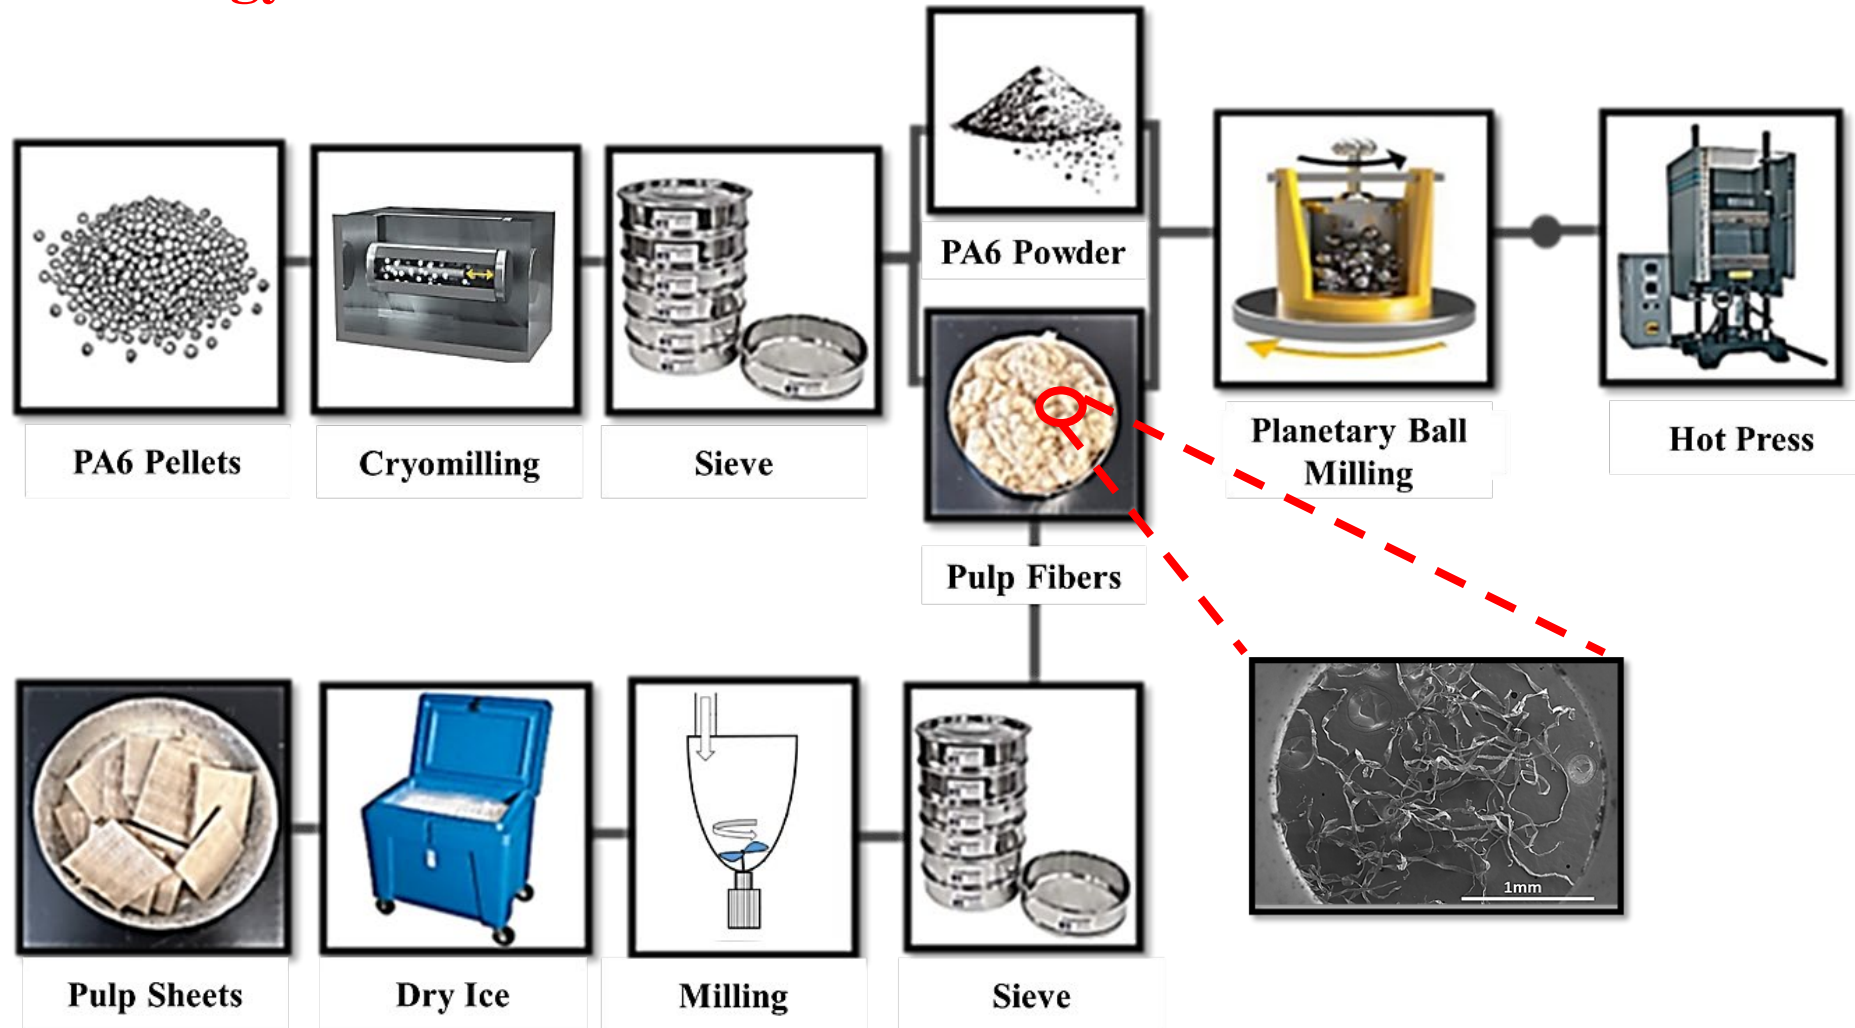

Hypothesis

- 1- Employing premixing planetary ball milling to reduce the degradation of cellulose fibers prior to polymer processing.
- 2- Micronizing the cellulose fibers improves thermal stability and dispersion quality.

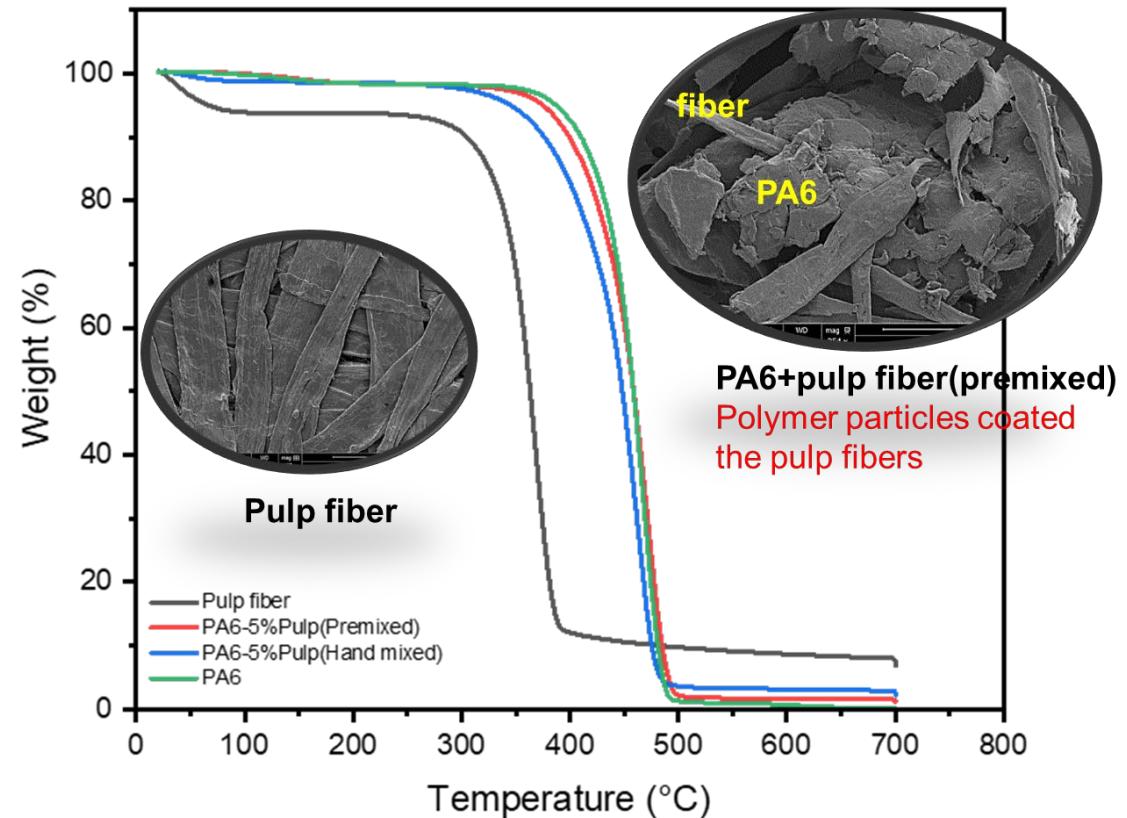

International Conference on Nanotechnology for Renewable Materials

Methodology

Effect of Premixing on Thermal Stability of Composite

| Sample | Onset thermal degradation(°C) |
|-----------------------------|-------------------------------|
| PA6 | 387 |
| PA6-5%pulp fiber (premixed) | 370 |
| PA6-5%pulp fiber (HM) | 290 |
| Pulp fiber | 160 |

Effective Parameters in Planetary Ball Milling Process

- Milling temperature
- Ball to powder weight ratio
- Diameter of ball milling
- Milling time

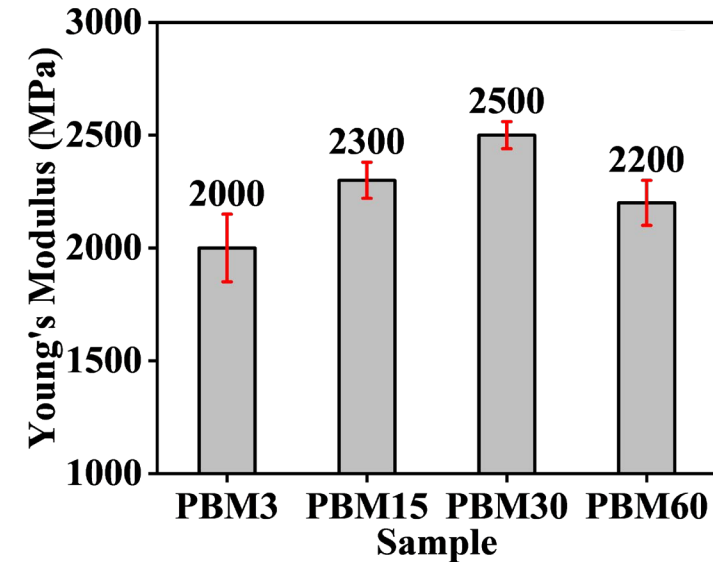

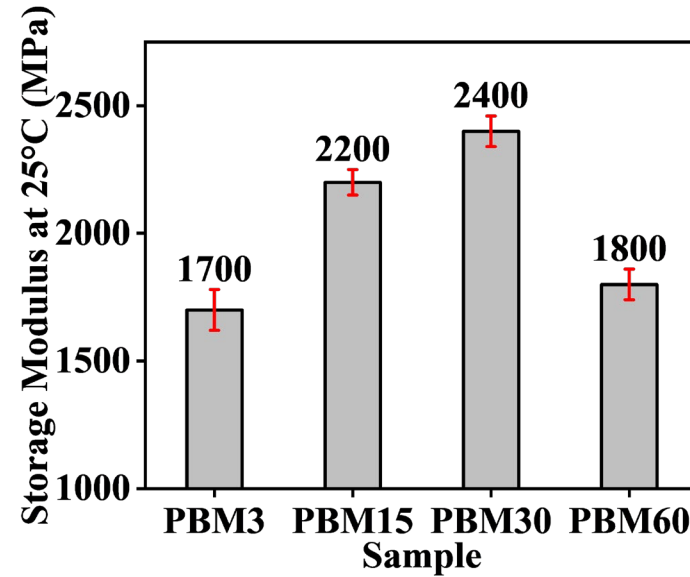

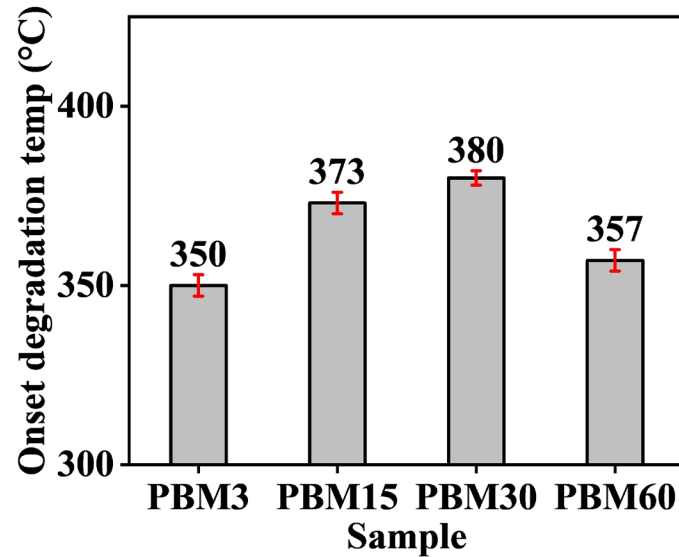

PA6- 5wt%Pulp fiber

| Sample name | Milling time (min) |
|-------------|--------------------|
| PBM3 | 3 |
| PBM15 | 15 |
| PBM30 | 30 |
| PBM60 | 60 |

International Conference on Nanotechnology for Renewable Materials

Thermomechanical Analysis

Neat pulp fibers before ball mill

Aspect ratio decrease from 15 to 12

Composite of PA6 with Different Concentrations of Pulp Fibers

According to the optimization study on the milling time, 30 min is chosen as a premixing time.

| Sample name | PA6 (wt%) | Pulp fibers (wt%) |
|--------------------|--|--------------------------|
| Neat PA6 | 100 | 0 |
| PA6-5PF | 95 | 5 |
| PA6-10PF | 90 | 10 |
| PA6-20PF | 80 | 20 |
| PA6-30PF | 70 | 30 |
| PA6-40PF | It was not possible to make a film due to phase separation | |

Morphology

Sample of PA6 reinforced with 30wt% PF after 30 min premixing

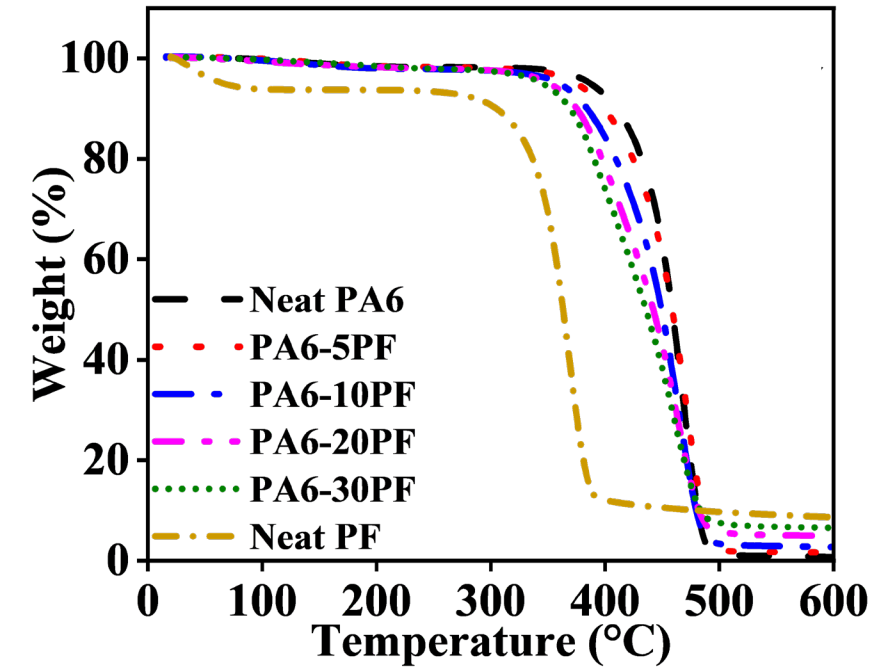

- Consistent distribution of pulp fibers
- PF embedded in polymer particles
- Chunky formed of fibers changed to spread-like form

Thermal Analysis

TGA

DSC

| Sample name | T _m (°C) | T _c (°C) | %X _c |
|-------------|---------------------|---------------------|-----------------|
| Neat PA6 | 221 | 190 | 26 |
| PA6-5PF | 221 | 189 | 27 |
| PA6-10PF | 222 | 188 | 28 |
| PA6-20PF | 223 | 187 | 31 |
| PA6-30PF | 222 | 187 | 33 |

- By incorporation of PFs, Onset degradation temperature decrease.
- Composite decomposition is the function of the amount of PFs.
- PFs can act as effective nucleating agents, promoting the formation of additional crystalline regions within the polymer matrix.

Mechanical Analysis

DMTA

Tensile Test

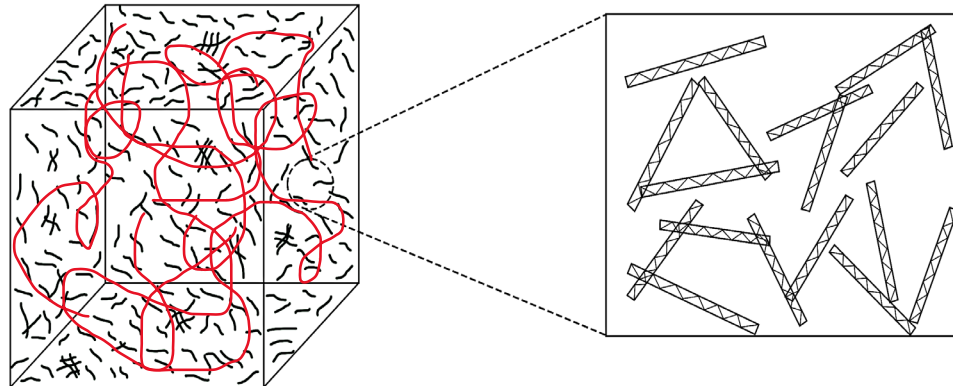

At 25°C

| Sample name | Storage modulus(MPa) | Young's modulus(MPa) | Ultimate tensile strength(MPa) |
|-------------|----------------------|----------------------|--------------------------------|
| Neat PA6 | 1300±110 | 1500±200 | 49±5 |
| PA6-5PF | 2300±50 | 2500±300 | 53±4 |
| PA6-10PF | 2900±90 | 3200±50 | 60±4 |
| PA6-20PF | 3150±60 | 3300±50 | 56±2 |
| PA6-30PF | 3400±100 | 3900±100 | 49±1 |

General Approach of Adding Nanoparticles to Polymer Composite:

- Enhanced mechanical properties without a decrease in processability.
- Improved flow behavior and viscosity control
- Improved compatibility with the polymer matrix
- Increased the sustainability of polymer composite.

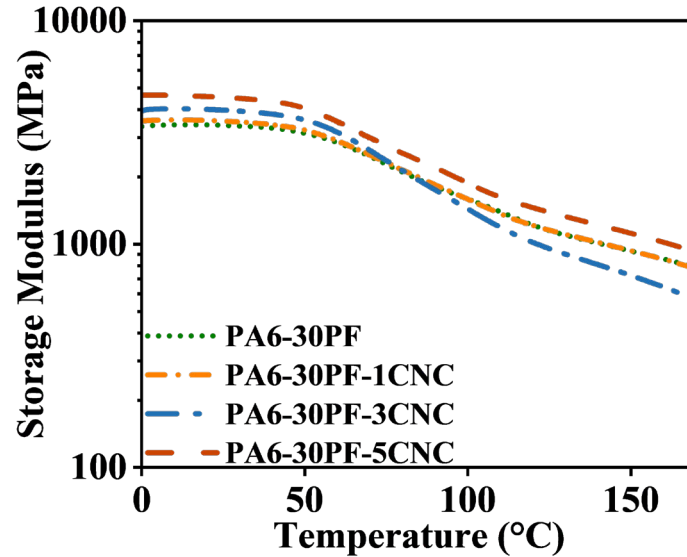

Addition of CNC to Improve Mechanical Properties

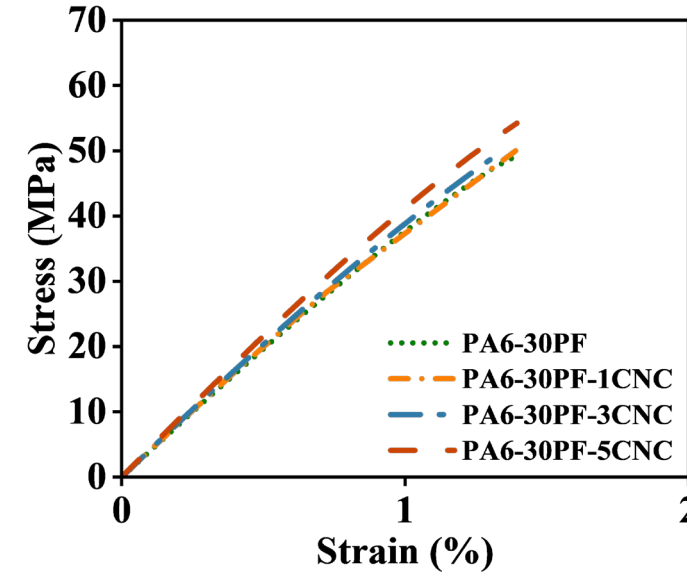

| Sample name | PA6(wt%) | PF(wt%) | CNC(wt%) |
|---------------|----------|---------|----------|
| PA6-30PF-1CNC | 69 | 30 | 1 |
| PA6-30PF-3CNC | 67 | 30 | 3 |
| PA6-30PF-5CNC | 65 | 30 | 5 |

Mechanical Analysis

DMTA

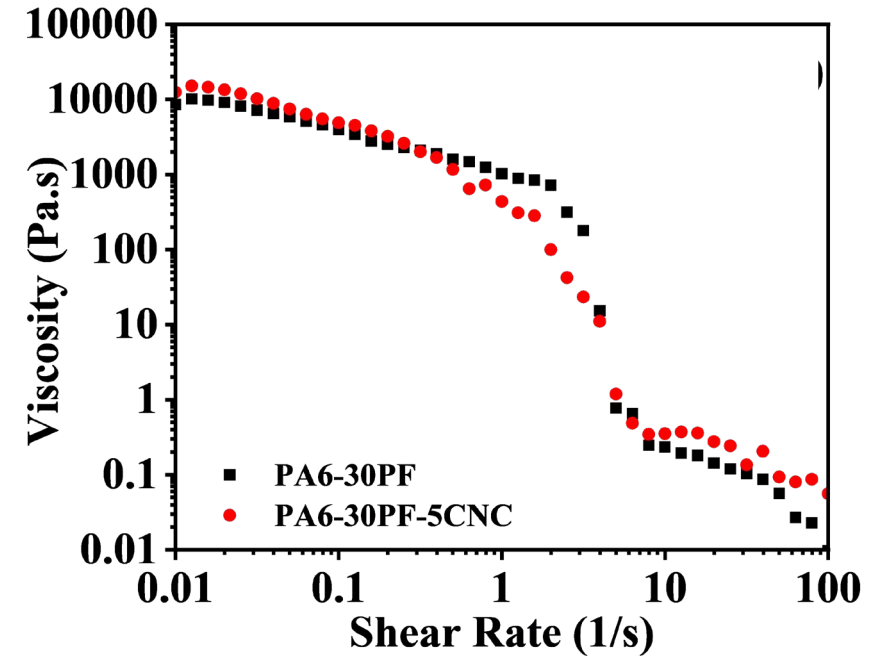

Tensile Test

At 25°C

| Sample name | Storage modulus (MPa) | Young's Modulus (MPa) | Ultimate tensile strength (MPa) |
|---------------|--------------------------|--------------------------|------------------------------------|
| PA6-30PF | 3400±100 | 3900±100 | 49±1 |
| PA6-30PF-1CNC | 3550±80 | 3900±120 | 48±1 |
| PA6-30PF-3CNC | 4000±50 | 4100±50 | 49±1 |
| PA6-30PF-5CNC | 4500±100 | 4300±90 | 54±2 |

Rheological Analysis

- The storage modulus of the polymer composite increases with the addition of CNC.
- The increase in viscosity was not significant, the processability of the composite is maintained

Morphology of Fracture Surface

PA6-30%PFs
Without premixing

PA6-30%PFs
With premixing

PA6-30%PFs-5%CNC
With premixing

- Pulled-out fibers are longer in the sample without premixing.
- Premixed samples show better dispersion of micronized fibers and more embedment in polymer matrices.
- Sample with 5wt% CNC, the interface between fibers and polymer becomes stronger, so fibers are not pulled out.

Conclusion

- 1-We showed premixing ball milling method is a promising technique to make polymer reinforced with CNF.
- 2-By introducing PFs up to 30wt% via ball milling, we made a strong polymer composite.
- 3- CNCs had a superior effect on mechanical properties of composite reinforced with PFs.

International Conference on Nanotechnology for Renewable Materials

Special Thanks

Thank you

Questions?

Water Uptake Capacity

- Premixed samples have lower water absorption.
 - Dimensional stability
 - Better mechanical properties
- Higher water uptake for the HM sample is related to bad dispersion of PFs in the sample.
